BUSINESS PROPOSAL

Coordina AI

Autonomous AI Teammate & Workflow Orchestrator

By Team BU ZHI DAO

UM HACKATHON 2026

1. Executive Summary

Coordina AI is an autonomous, AI-powered workflow orchestrator designed to transform unstructured collaborative projects into structured, traceable execution workflows. While initially conceived to solve the inefficiencies of student group work, the platform is highly scalable to corporate teams, startups, and research workflows. By operating as an intelligent reasoning core powered by the Gemini 3 Flash Lite model, Coordina AI replaces passive collaboration utilities (like standard document editors or chat apps) with an active, multi-agent teammate. For educational institutions and corporate workplaces, Coordina AI offers a robust B2B SaaS solution that shifts project management from manual coordination to intelligent supervision. It provides professors, educators, and project managers with an unprecedented level of administrative oversight into team dynamics, continuous risk detection, and automated performance tracking

.

2. Product Overview / Solution

2.1 Key Features:

For the team, Coordina AI helps with:

- **Unstructured Data Ingestion:** Automatically parses and extracts structured goals from messy project briefs, grading rubrics, meeting transcripts, and informal chat logs.
- **Autonomous Workflow Orchestration:** Replaces manual planning by automatically generating task lists, setting milestones, establishing critical paths, and assigning roles based on team capacity.
- **Continuous Risk Monitoring:** A dedicated risk agent continuously monitors project state to detect inactive team members, flag blocked tasks, and predict deadline failure probabilities, triggering auto-recovery plans when necessary.
- **Submission Readiness Validation:** Automatically cross-references completed deliverables against the initial grading rubric to generate a readiness score, ensuring no critical requirements are missed before the final deadline.
- **Real-Time State Tracking:** Provides a centralized, live dashboard featuring workflow timelines, contribution analytics, and an audit log of all AI-driven management decisions.

On the other hand, for administrators like University Lecturers or Project Managers in the workspace, Coordina AI helps to:

- Provides deep oversight by continuously scanning member activity, flagging inactive participants (using metrics like Jain's fairness index to track contribution balance), and calculating "deadline failure probability". It shifts project oversight from reactive, manual intervention to proactive, intelligent supervision.

2.2 Technology Used:

- **Gemini 3.1 Flash Lite**: Acts as the central intelligence engine, powering a system of specialized autonomous agents (Analysis, Planning, Coordination, Risk, and Submission) to execute multi-step logic.
- **FastAPI & WebSocket Integration**: An async-native Python backend that handles the orchestration engine and streams live pipeline events directly to the user interface without polling delays.
- **Dual-Layer Memory System**: Utilizes Redis for high-speed, transient workflow state management and session data, paired with PostgreSQL via SQLAlchemy for the persistent, durable storage of project records and decision logs.
- **React + Vite Frontend**: A highly responsive, component-driven web application that renders the dynamic workspace, live dashboards, and task checklists.

3. Market Research & Market Dynamics

3.1. Problem Landscape

University group projects consistently suffer from extreme workflow fragmentation. Critical project requirements, rubrics, and decisions are scattered across informal chats (WhatsApp), shared documents (Google Docs), and academic portals. This chaos results in the ubiquitous "free-rider" problem, uneven workload distribution, and last-minute deadline panic. Existing productivity tools fail to solve this because they rely entirely on manual human coordination and cannot actively interpret project requirements or enforce accountability.

3.2. Market Niche

Coordina AI primarily targets Gen-Z university students and hackathon participants who are highly tech-literate but lack formal project management experience. These users prioritize speed, automation, and equitable workload distribution. The secondary niche includes university instructors and hackathon organizers who require transparent, data-driven visibility into team collaboration and individual contribution levels.

3.3. Market Sizing

Marketing Tier	Definition	Estimated Value (2026)
TAM (Total Addressable Market)	Global Higher Education Productivity & EdTech Software Market	RM 8.5 billion
SAM (Serviceable Addressable Market)	University Students & Hackathon Organizers in Southeast Asia	RM 320 million
SOM (Serviceable Obtainable Market)	Realistic market capture (1.5 years) targeting tier-1 Malaysian universities (e.g., Universiti Malaya) and regional tech competitions	RM 5.2 million

3.4. Market Dynamics & Placement

- **Generative AI Normalization:** University students already universally utilize conversational LLMs for drafting and brainstorming. The market is primed for the next evolution: shifting

from AI as a passive text generator to AI as an active, stateful workflow orchestrator.

- **Digital Tool Fatigue:** Students are overwhelmed by juggling multiple platforms for a single assignment. Coordina AI capitalizes on this by ingesting unstructured data directly from the tools students already use (chats, transcripts, briefs), centralizing the management process without forcing them to change how they communicate.
- **Demand for Academic Accountability:** Universities are increasingly scrutinizing how group work is graded to ensure fairness. Coordina AI's automated role assignments, continuous risk monitoring, and calculated fairness index directly address institutional demands for transparent contribution tracking.

4. Value Proposition & Competitive Advantage

Coordina AI is redefining student collaboration by shifting project management from a passive, manual chore into an autonomous, stateful process. By utilizing the Gemini 3.1 Flash Lite as its core reasoning engine, Coordina AI acts as an active, operational "AI Teammate" rather than just a digital canvas. It ingests the unstructured data students already produce, such as chat logs, meeting transcripts, and PDF grading rubrics, and automatically orchestrates task delegation, timeline planning, and risk management. This eliminates the "free-rider" problem, ensures the final submission directly matches the rubric criteria, and reduces the coordination friction that typically derails student group work.

Compared to established competitors like Notion, Trello, or standard conversational LLMs, Coordina AI holds a distinct competitive advantage through its active multi-agent architecture and stateful memory. Traditional productivity tools require extensive manual data entry to create tasks and monitor progress, whereas Coordina AI does this autonomously. Furthermore, conversational LLMs lack persistent structural memory over a multi-week timeline. Coordina AI's dual-layer memory system that utilizes Redis for transient workflow state and PostgreSQL for persistent decision logs, enabling proactive risk detection, such as flagging inactive members or predicting deadline failures before they happen. This end-to-end, agentic workflow intelligence cannot be easily replicated by passive productivity tools without entirely rebuilding their core infrastructure.

5. Competitor Analysis (Porter's Five Forces)

Force	Intensity	Assessment
Competitive Rivalry	High	Competitors like Notion, ClickUp, and Trello are deeply entrenched in the education space with large, loyal student user bases.
Threat of New Entrants	Medium	While building basic task-management interfaces is relatively easy, developing a reliable, stateful multi-agent system powered by GLM requires significant technical complexity and architectural maturity.
Bargaining Power of Buyers	High	University students are highly price-sensitive and accustomed to free tiers on existing platforms. Switching costs are low, meaning Coordina AI must prove immediate time-saving value to retain users.
Bargaining Power of Suppliers	High	Coordina AI's core reasoning engine relies on the Gemini 3 Flash Lite API. Changes in API pricing, token limits, or latency from the AI provider directly impact our operational costs and performance.
Threat of Substitutes	Medium	General-purpose LLMs (like ChatGPT or Claude) serve as substitutes for ad-hoc drafting, and traditional manual coordination (WhatsApp + Google Docs) remains the default behavior. However, neither offers stateful workflow execution.

Competitor Comparison Table:

Competitor	Strength	Weakness	Coordina AI's Advantage
All-in-One Workspaces (e.g., Notion, ClickUp)	Highly customizable, massive existing user base, excellent for static documentation and wiki building.	Passive systems that rely entirely on manual human input for task creation, role assignment, and progress tracking.	**Active Orchestration:** Coordina AI actively ingests unstructured briefs and rubrics to autonomously generate tasks and assign roles using

			the GLM reasoning engine. It acts as a manager, not just a database.
Conversational AI (e.g., ChatGPT, Claude)	Exceptional at generating text, brainstorming ideas, and answering ad-hoc project questions quickly.	Stateless by default. They lack persistent structural memory over a multi-week project and cannot orchestrate backend application tasks.	**Stateful Memory:** Maintains persistent project state via Redis and PostgreSQL, allowing the AI to track team activity, decisions, and progress across the entire project lifecycle.
Task Managers (e.g., Trello, Asana)	Intuitive, visual Kanban interfaces that are easy to adopt for simple project tracking.	Cannot reason about the *content* of the tasks. Cannot predict deadline failures or detect team inactivity without a human manager intervening.	**Autonomous Risk Management:** Deploys a dedicated Risk Detection Agent that continuously monitors for inactivity and deadline risks, triggering automated recovery plans without human prompting.
Manual Coordination Tools (e.g., WhatsApp, Google Docs, MS Teams)	Universally accessible with zero learning curve. The standard for real-time informal communication and live document co-editing.	Causes extreme workflow fragmentation. Project requirements, decisions, and deliverables are scattered across multiple silos, leading to responsibility ambiguity and missed deadlines.	**Centralized Workflow Intelligence:** Coordina AI actually ingests these unstructured inputs (chat logs, meeting transcripts, briefs) and uses GLM to transform them into a unified, structured execution plan with automated accountability tracking.

6. Business Model Canvas

6.1. Customer Segmentation

1. **Academic Institutions & Educators (B2B - Primary):** Lecturers, faculty heads, and educators seeking comprehensive insights into team collaboration dynamics. This segment requires transparent oversight to prevent free-riding, leveraging the system's ability to track contributions and calculate fairness indexes. It allows professors to act as intelligent supervisors rather than manual coordinators, ensuring all student work is up to par through automated rubric coverage validation and submission readiness scoring.
2. **Corporate Teams & Workplaces (B2B - Secondary):** Project managers and team leads in corporate environments, startups, or research workflows looking for highly scalable project oversight. They value the system's ability to continuously monitor project progress, track team activity, and dynamically adapt execution strategies. The platform provides admins with real-time risk detection for team inactivity and deadline failures, shifting teams into structured and adaptive execution workflows.
3. **Event Organizers (B2B - Tertiary):** Hackathon and event operators needing a scalable platform to monitor team health in short periods. They require tools to identify at-risk teams for mentor intervention and ensure submission readiness during high-stress competitions.

6.2. Revenue Stream

- **Primary (B2B Enterprise Licensing for Education):** Bulk institutional licenses sold directly to universities or faculties (priced per cohort or faculty size). Students use the platform for free, while the institution pays for the ability to integrate Coordina AI into their curriculum. This provides educators with a centralized dashboard to access full project state data, performance metrics, and workflow visibility.
- **Secondary (B2B Corporate/Workplace SaaS):** Tiered subscription models for businesses and research labs. Companies pay a recurring fee to utilize the autonomous multi-agent reasoning, continuous risk monitoring, and automated recovery workflows to keep their internal projects on track.
- **Promotional/Event:** A fixed event fee (Approx. RM 2,000 - RM 5,000) for event organizers to deploy the platform, giving organizers a centralized team health dashboard and providing participants with premium guided workflows.

- **Strategic Sponsorships / AI Grants (Target: Z.AI):** Securing direct sponsorship or infrastructure grants from Z.AI, the provider of the system's core ILMU-GLM-5.1 reasoning engine. Because Coordina AI serves as a live demonstration of agentic AI systems and specifically highlights the capabilities of GLM as a reasoning-first AI, it acts as a powerful marketing tool for Z.AI. In exchange for showcasing the model's ability to handle multi-step reasoning, unstructured project briefs, and continuous workflow management, Z.AI could provide financial sponsorship or subsidize the platform's API token consumption costs.

6.3. Cost Structure

Cost Type	Cost Drivers
Fixed Cost	Cloud infrastructure hosting, including Render for the FastAPI backend, Vercel for the React/Vite frontend, managed PostgreSQL for persistent data, and Redis for stateful workflow memory.
Order-based/ Variable Cost	Gemini 3 Flash Lite API token consumption is the primary variable cost, fluctuating based on the complexity of project briefs, the frequency of continuous multi-agent reasoning loops, and continuous workflow management.
Overhead Cost	Ongoing product research and development, direct B2B sales and marketing campaigns targeting university administrators and corporate project managers, enterprise user onboarding support, and general platform maintenance.

6.4. Key Partners

Internal:

- Development Team (AI, Frontend, Backend architecture leads).
- University Malaya Faculties (for initial beta testing and feedback loops).

External:

- **Cloud Infrastructure Providers:** Render, Vercel, Neon, and Upstash for scalable hosting.

- **Event Organizers:** (e.g., hackathons, career fairs, workshops) for Go-To-Market distribution and validation.

6.5. Risk Assessment

Risk Type	Impact	Likelihood	Mitigation
High AI Token Costs / Overruns	High	Medium	Implement strict token efficiency practices: keep prompts scoped to specific tasks, cache derived outputs, and reuse structured state to minimize redundant GLM calls.
Low Student Willingness to Pay	High	High	Maintain a robust free tier to build daily habits and user dependency; aggressively target the B2B Institutional Licensing model where the university absorbs the cost.
System Outage During Deadlines	High	Low	Implement stateless backend scaling, automated retry handling for AI service outages, and graceful fallback messaging to ensure users never lose data during panic hours.
Data Privacy & Academic Integrity	Medium	Medium	Restrict database access to service accounts, enforce least-privilege deployment permissions, and ensure strict sanitization so no credentials or sensitive data are exposed to users.

7. Implementation & Financials

7.1. Go-to-Market Strategy

Coordina AI adopts a "Campus and Corporate Event" rollout strategy. Launching first at Malaysian universities (e.g., University Malaya) and local tech events (e.g., hackathons, career fairs, workshops) allows us to capture high-density clusters of our end-users. We will utilize a product-led growth model: a robust free-tier for basic document parsing and student task management will drive widespread adoption. This grassroots usage acts as a wedge to sell B2B Enterprise Licensing to faculty heads and project managers. We will aggressively market the platform's ability to provide admins with transparent oversight of group dynamics, objective fairness evaluation metrics, and automated risk detection to ensure student/team work is up to par. Simultaneously, event partnerships will serve as paid, high-visibility distribution channels.

7.2. Implementation Plan

Phase	Action	Timeline	Target
Soft Launch	Launch at Universiti Malaya & local tech event. Backend hosted on Render, Frontend on Vercel.	Month 1-4	500 Active Projects/month; 3 event partnerships.
Expansion Phase	Expand to other tier-1 universities (USM, UTM, Taylor's). Push B2B Institutional Pilot programs.	Month 4-12	2,500 Active Projects/month across 5 campuses.
Optimization	Optimize Gemini 3 Flash Lite API token efficiency and scale the stateless FastAPI architecture.	Month 12-18	Reach operational breakeven; secure 5 annual institutional licenses.
TOTAL	RM 1.2M seed investment	18 Months	Dominant market share in Malaysian university group work.

7.3. Revenue Projections (3-Year)

Metric	Year 1	Year 2	Year 3
Active Campuses	5	18	45
Monthly Active Projects	2500	8500	25000
B2B Institutional Licenses (Universities)	2	10	35
B2B Corporate SaaS Subscriptions	20	150	500
B2B Institutional / Corporate Revenue	RM 144,000	RM 630,000	RM 2,160,000
Event Deployment Revenue	RM 50,000	RM 350,000	RM 950,000
Total Revenue	RM 194,000	RM 980,000	RM 3,110,000
Net Position	RM (450,000)	RM (85,000)	RM +1,250,000

Note: Year 1 and 2 operate at a loss due to high initial R&D, continuous stateful Redis/PostgreSQL hosting costs, and potentially sponsored Z.AI GLM-4 API tokens to acquire the initial user base.

7.4. Key Financial Milestones

- **Month 4:** Achieve 500 active monthly projects across Universiti Malaya and complete 3 paid hackathon deployments.
- **Month 12:** Expansion to 5 tier-1 campuses, reaching 2,500 active projects and stabilizing core cloud infrastructure costs (Render, Vercel, Upstash).
- **Month 18:** Reaching break-even point with a positive contribution margin, driven by closing our first major B2B Institutional Licenses (selling the oversight and rubric validation features to faculty heads)
- and optimizing prompt token limits.
- **Month 30:** Fully cashflow positive; feasibility review for expanding into the broader Southeast Asian higher-education market.
